

MapleSure Advisor Portal - Secure Sign-In (New Application)

Business Objective

MapleSure's licensed group-benefits advisors have no online entry point of their own today: advisor interactions arrive by phone and email and are re-keyed by service staff into internal systems. The business wants a new, standalone Advisor Portal web application, delivered incrementally, whose first release is deliberately small: a secure sign-in page that establishes the application, its repository and its delivery pipeline, so later releases can add advisor-facing features on a foundation that already exists.

Requirement Summary

This is a new application, not an enhancement to the existing Sponsor Portal or Claims API. Release 1 is limited to authentication surface only: a login page, a welcome landing page after successful sign-in, and sign-out. The implementation should stay simple and self-contained, using a local credential store seeded with demonstration accounts; integration with the enterprise identity provider is a later release.

Requirements

1. The application must present a sign-in page with an email address field and a password field, reachable at the application root.
2. The sign-in form must validate input before submission: both fields are required, and the email address must be well-formed. Validation messages must appear next to the field they concern.
3. The password field must be masked by default and must provide a show/hide toggle.
4. Submitted credentials must be checked against a local credential store seeded with demonstration advisor accounts; no external identity provider is called in this release.
5. A failed sign-in must show a single generic error message that does not reveal whether the email address or the password was incorrect.
6. A successful sign-in must land the advisor on a welcome page that greets them by name and shows a visible sign-out control.
7. Signing out must clear the session and return the advisor to the sign-in page; the welcome page must not be reachable after sign-out.

Out of Scope for Release 1

Multi-factor authentication, self-service password reset, account lockout policies, and enterprise identity provider integration are explicitly out of scope and will be scheduled as later releases of the Advisor Portal.
