

S7 Overnight End-to-End — Evidence Report

2026-08-17/18 · run `S7-00035` (Live) · requirement REQ-2026-121 “MapleSure Member Sign-In” · repo `github.com/AlanLands/maplesure-member-signin` · fully autonomous run. Preflight: 649 repo tests passing; provider gpt-4o, LLM_MODE=record (recordings committed by the run).

1 · Requirement in (upstream)

The business requirement `REQ-2026-121` — **MapleSure Member Sign-In**, a brand-new application — was authored as a markdown document and uploaded by the Business Owner into a **live** Control Centre run (`S7-00035`). A real gpt-4o call extracted it.

AI extraction

provenance live_ai · 8 requirements · title “MapleSure Member Sign-In”

The screenshot displays the S7 Delivery Control Centre interface. At the top, it shows the scenario "Online disability claim submission for plan sponsors", run ID "S7-00035", and environment "Live". A progress bar indicates the current stage is "Intake Ready". The main content area is titled "Intake — Requirement Input" and includes a section for "1. Source Requirement" with an "Upload File" button and a "Drag & drop your file here" area. To the right, a section titled "2. AI Extraction (Completed)" shows the results of the extraction, including a table with the title "MapleSure Member Sign-In", business objective, and requirement summary. The bottom of the interface features a status bar with various indicators like "Governed", "Traceable", "Human-approved", "Audit-ready", and "Release-safe".

Title	MapleSure Member Sign-In
Business Objective	MapleSure members currently have no dedicated online entry point: every digital journey begins with a phone call to the service desk for identity verification. We need a standalone member sign-in application — the front door for all future...
Requirement Summary	Develop a standalone member sign-in application that allows MapleSure members to authenticate online using their member ID and password. Ensure accessibility, security, and a shared authentication platform for future member...

Extracted Requirements	
REQ-2026-121-1	A member can sign in with their member ID and password on a single, clearly branded MapleSure sign-in page.

Intake page — live AI extraction of the uploaded requirement evidence/02-intake-extraction.jpg

2 · Routing says: new application

Routing verdict

new_application_needed — “No repositories are connected yet.” (no model call: deterministic short-circuit)

The conversational setup (live model, capped rounds) settled `maplesure-member-signin`, Flask + SQLite; the scaffold (architecture.md + README) was generated and, on explicit approval, **a real GitHub repository was created:** `github.com/AlanLands/maplesure-member-signin` — then cloned back and connected, grounding everything downstream.

3 · Analysis → clarifications → plan → sign-off

Live analysis

provenance live_ai · confidence 95 · 8 business rules extracted · 2 clarification questions auto-queued and answered by the business

Human business rule

BR-H1 — lockout auto-release semantics (survives re-analysis; planning must cover it)

Live plan

4 stories · confidence 90 (live_ai) · coverage 100% agentic · design artifact derived (RULE_BASED, DFD + relationship)

The screenshot displays the 'S7 Delivery Control Centre' interface. At the top, a progress bar shows the workflow: Intake (Completed) → Planning (In progress) → Build & Review (Pending) → Final Gating (Pending) → Release (Pending). The main content area is titled 'Epic to Stories (AI Decomposition)' and includes a table of stories. The table has columns for EPIC ID, TITLE, OWNER, DOMAIN, EST. STORIES, and AI STATUS. Below the table, there are summary cards for Total Stories (4), Teams Involved (3), Acceptance Criteria (10), Dependencies (3), and Planned Sprints (3), along with an AI Plan Confidence of 90%. A checklist on the right side, titled 'Gate 1: Plan Sign-off', lists various tasks and their completion status. The bottom of the interface shows a status bar with labels like 'Governed', 'Traceable', 'Human-approved', 'Audit-ready', and 'Release-safe'.

EPIC ID	TITLE	OWNER	DOMAIN	EST. STORIES	AI STATUS
EPIC-S7-001	MapleSure Member Sign-In	GA Group Benefits Operations	Group Disability	4	✓ Analysed

STORY ID	TITLE	ACCOUNTABLE TEAM	SPRINT	ESTIMATE	STATUS
US-1	Implement Sign-In Page with Accessibility and Branding	PT Portal Team	S1	5 pts	READY

Epic to Stories — live plan, gate checklist filling evidence/14-planning-page.jpg

Go passed by the Business Owner; G1 signed by P. Moreau — plan locked v1, four tasks seeded.

4 · Governed context published (real git)

Architecture v1 generated and accepted (A. Osei). Three team delivery packs generated; the QA Lead approved each AC-derived test plan (R. Tanaka). **Publication pushed real branches** — s7/s7-00035-portal-team, -services-team, -data-team — carrying AGENTS.md, .s7/** context and deliberately-failing test skeletons: the red CI baseline.

5 · The agentic lane, with the reviewer doing its job

Every story ran the **real** Developer→Tester→Reviewer lane (live gpt-4o + real pytest, in the run's own artifact tree). US-1's first build was **blocked by the independent reviewer** — missing MapleSure branding and a genuine WCAG contrast failure — returned to development, corrected, and passed second review. US-2, US-3, US-4 passed first time.

US-1

lane 88s → review BLOCKED (FND-001 branding, FND-003 contrast) → corrected 44s → PASSED

6 · Developer flow: clone → implement → PR → merge

Acting as the assigned developer: cloned the repo, merged all three s7/ context branches, implemented the full Flask application, and turned every red skeleton into a real assertion — **keeping the governed test names** (two truncation mismatches caught and fixed). 10/10 green locally → pushed `feature/member-signin` → **PR #1** → **merged (squash)** → CI green on main. A follow-up commit added `pytest-cov`, and CI now reports **98.5% line coverage**. (GitHub's API had a ~30-minute 503 outage mid-flow; a retry loop rode it out.)

PR #1 merged — 7 commits, the s7 context commits showing their red-baseline $\times$ evidence/33-github-pr-merged.jpg

7 · Real evidence → quality → release

Git evidence sync read the merged commit and green CI into all four workspaces. The final gate initially **refused** (coverage: no data) — then passed once CI carried the coverage artifact: QC-05 reads **98.5% (threshold 80%)**. G3 passed. Release: five named approvals (P. Moreau, A. Osei, R. Tanaka, S. Lindqvist, N. Whitfield), release document generated, **deploy + handover** — **G4 passed, run COMPLETED**.

Release page — REL-2026R4-001 completed, all five approvals PASSED evidence/34-release-complete.jpg

8 • The living application

The merged application runs at `http://127.0.0.1:8899` — synthetic member `M1001` .

Appendix • Full step log

Overnight E2E — 2026-08-17 — step log

Step 0 — Preflight & cleanup (22:1x)

- Removed byte-identical duplicate `S7-Solution-Overview 2.pdf` from root (commit a995328).
- Full test suite: **649 passed** → evidence/00-pytest.txt
- Env: LLM_PROVIDER=openai gpt-4o, LLM_MODE=record (live calls, recordings written); gh authenticated (AlanLands).

Step 1 — Requirement document (upstream input)

- Authored `crs/REQ-2026-121-member-signin.md` — MapleSure Member Sign-In, a NEW application (8 requirements: credential sign-in, generic errors, 5-attempt lockout, forgot-password placeholder, audit log, no plaintext passwords, WCAG AA).

Step 2 — Live run + upload + AI extraction

- Created live run **S7-00035**; uploaded the requirement (business_owner).

- Real gpt-4o extraction in 6.9s: title "MapleSure Member Sign-In", 8 requirements, provenance ****live_ai**** → evidence/01-upload-extraction.json

Step 3 - Routing → new application (the governed front door)

- `intake/route` with zero repos connected → verdict ****new_application_needed****, "No repositories are connected yet", no LLM call → evidence/04-routing.json
- New-app setup chat (live gpt-4o): asked one question (stack); answered Flask+SQLite + repo name → settled name ****maplesure-member-signin**** → evidence/05,06
- Scaffold generated (architecture.md + README, live call) → evidence/07
- ****Real GitHub repo created****: <https://github.com/AlanLands/maplesure-member-signin> (gh repo create --push), cloned back + connected → evidence/08

Step 4 - Analysis → clarifications → epic → G0

- Live analysis grounded in the new repo: provenance live_ai, confidence 95, ****8 business rules extracted****; analysis auto-queued 2 clarification questions → evidence/09
- Business answered both (credential store = internal SQLite w/ salted hashes; audit log internal) → evidence/10
- Human business rule ****BR-H1**** added (lockout auto-release semantics) → evidence/11
- Epic EPIC-S7-001 "MapleSure Member Sign-In" created from extraction; ****G0** passed by business_owner** → evidence/12,13

Step 5 - Live plan + design + sign-off

- Live plan: ****4 stories**** (US-1 sign-in page/Portal, US-2 credential validation/Services, US-3 audit logging/Data, US-4 password-reset link/Services), confidence 90 live_ai; coverage 100% agentic; ****design artifact derived (RULE_BASED, DFD + relationship)**** → evidence/14-plan.json, 14-planning-page.jpg

Step 6 - Downstream: architecture → packs → publish (real git)

- Architecture v1 generated (RULE_BASED) + accepted by A. Osei → evidence/16,17
- 3 delivery packs (Portal/Services/Data) + QA test-plan approvals by R. Tanaka → evidence/18
- ****publish-all: real pushes**** - branches s7/s7-00035-{portal,services,data}-team on GitHub, simulated:false → evidence/19

Step 7 - Live agentic lane (real code, real pytest, real review)

- US-1: lane ran 88s of real gpt-4o calls; ****reviewer BLOCKED it**** (missing branding, WCAG contrast) → return-to-development → corrected in 44s → ****passed**** → evidence/20,21,22
- US-2 (61s), US-4 (46s), US-3 (70s): all lanes ran live, all reviews passed → evidence/24-*

Step 8 - Developer flow: clone → implement → PR → merge (real GitHub)

- Cloned repo, merged all three s7/ context branches (resolved shared-file conflicts, union of manifests)
- Implemented the full Flask app (app.py) + real assertions in the governed test names (fixed 2 truncation mismatches vs the skeletons); 10/10 locally
- Pushed feature/member-signin; GitHub API had a ~30min 503 outage - PR created via retry loop: ****PR #1**** → merged (squash) as b2a9821; CI ****green**** on main
- Coverage fix: pytest-cov + pytest.ini (first commit missed the untracked ini - caught via CI log, fixed in 4f2e650); CI now emits ****coverage 98.5%****

Step 9 - Evidence sync → quality → release

- workspaces/sync-git: all 4 stories at merged commit, ci passed, development complete → evidence/25
- Quality: QC-05 read the real 98.5% tip coverage; ****G3 passed**** → evidence/27,28
- Release: 5 role approvals, release document generated, ****deploy + handover - G4 passed, run COMPLETED**** → evidence/29

Step 10 - The live application

- App served at <http://127.0.0.1:8899> from merged main
- Sign-in page (branded, labelled, accessible) → evidence/30
- Wrong password → the one generic error → evidence/31
- M1001 + valid password → "Welcome, Avery Example", previous sign-in shown → evidence/32
